

Cable tray and cable tray connection piece

Article Overview

Cable tray connecting pieces include splice plates, elbows, tees, crosses, clamps, and quick-connect systems to join, support, or redirect cable trays safely and efficiently.

Types of Cable Tray Connecting Pieces

1. Splice Plates and Bolted Connections Splice plates are flat metal plates with holes that are bolted to the ends of two tray sections to join them in a straight line. They provide strong, secure connections suitable for most tray types and allow for future adjustments or maintenance. Bolts and nuts are used as fasteners, requiring tools like spanners or torque wrenches for installation (). 2. Quick-Connect Systems These are specialized systems that snap, slide, or twist together, often requiring few or no tools. They allow for rapid installation, saving labor time, and are typically compatible with a single manufacturer's brand (). 3. Elbows, Tees, and Crosses L-, T-, or cross-shaped plates are used to join tray sections at angles or junctions. These fittings help route cables around corners, splits, or intersections, ensuring smooth directional changes in the cable system (). 4. Clamps and Supporting Brackets Clamps secure trays to walls, ceilings, or other structures, while supporting brackets and suspension rods provide stability for horizontal or vertical runs. These accessories prevent sagging and maintain system integrity (). 5. Expansion and Reducer Fittings Expansion screws, risers, and reducers allow for changes in tray height, width, or accommodate thermal expansion. They ensure the system remains flexible and durable under varying load conditions ()....
