

Can a switch s PoE port be connected to another PoE port

Article Overview

You can connect a PoE switch to another PoE switch for network data, but the upstream PoE port will not safely power the downstream switch unless it is specifically designed for PoE-in.

Key Points

1. Standard PoE Ports Are Not Designed to Power Other Switches Typical PoE switches provide power to devices like IP cameras, access points, or VoIP phones. Connecting a PoE port from one switch directly to a PoE port on another switch will not safely deliver power to the second switch and could exceed power limits or damage devices if attempted . Most switches require their own power supply. 2. Network Connectivity Is Safe You can connect two PoE switches using standard Ethernet ports for data transmission. This is commonly done via uplink ports or regular ports using straight-through cables. The downstream switch will function normally for network traffic, but it will draw power from its own power source, not from the upstream PoE port . 3. PoE Pass-Through Switches Some specialized switches, called PoE pass-through switches, can receive PoE power on one port and redistribute it to other ports. These are rare and have strict power limitations, as the incoming power must be shared among all connected devices . Only these switches can be powered via PoE from another switch. 4. Cascading and Stacking

- Cascading: Connect switches in series to expand network ports. Use uplink ports if available, and ensure cable lengths do not exceed 100 meters per segment
