

Fiber optic cables do not distinguish between A and B ends

Overview

In (A-B) polarity, the transmit signal on one end (fiber A) aligns with the receive signal on the opposite end (fiber B). This straight-through connection allows data to flow seamlessly between devices, and A-B polarity is generally achieved with standard A-B duplex patch cords. Since fiber optic links require a two-way - or duplex - connection, there is potential for errors in installation by connecting transmitter to transmitter or. Fiber polarity is the direction that light signals travel from one end of a fiber optic cable (link) to the other. Although it may seem obvious, fiber optic polarity is a frequent source of confusion and. Polarity in fiber optic networks refers to the alignment of transmit (Tx) and receive (Rx) signals between interconnected devices.
