

How to capture packets on a core switch

Overview

To enable PCAP on a switch: Select Site > Wired > Switch Packet Captures. Select a site from the Site drop-down list. Click the + icon next to the Add Switch field, and select the switch on which you want to enable packet capture. You can select multiple switches for a single packet. Embedded Packet Capture (EPC) is an embedded system management tool used for tracking and troubleshooting network packets. This tool helps network administrators capture packets entering and leaving Cisco devices. It also depends on the intended actions for the matched. This guide will take you through a detailed, step-by-step process of setting up and executing packet capture, ensuring you can diagnose network issues with precision and ease. Essentially, Packet capture and packet analysis are made possible by the multi-step packet capture protocol (PCAP), which makes use of many tools. VACL options include: The capture action sets the capture bit for the forwarded packets so that ports with the capture function enabled can receive the packets.
