

How to configure the 1310 light module

Overview

Power On by pressing the yellow power button in the top left corner. The TIS 1310 will default to normal Lux / Auto setting. Prior to commissioning the GC1310 MLC(s), you may need to register to obtain a passkey from gridComm which is to be validated by the Street Light. 1310 can be custom programmed to provide application specific vehicle functions, from the most complex to the most unique. We will use the LoRa library for the communication, and we will not use any external. Special Note: There are now more enable (on) and disable (off) bindings available are not bound by default. Generally there is a bound Toggle but also Enable / On and Disable / Off unassigned keybinds for nearly all options. These can be found in the Advanced Key Bindings in game and are too many. We just posted a guide on how to build a connected street lighting system with the CC1350 (also applies to the CC1310) that should be of interest to people here: The system uses PWM dimming, time-synchronized scheduling, and remote control for thousands of street lights. The prototype uses a CC1350. The Curtis 1310 vehicle system controller provides unprecedented flexibility and ease-of-use.
