

How to leave power supply for the socket in an integrated cabinet

Overview

The best way is to leave a minimum distance of around 3 inches beneath the socket. Sockets that are installed too close to the floor of the cabinet can mean damage to connected devices cords. The most frequent application involves task lighting, specifically under-cabinet fixtures that provide illumination directly onto the countertop work surface. This localized lighting improves visibility. Sockets behind appliances are an inconvenience and where this has occurred, a switch should be installed elsewhere that has the ability to shut off the power to that socket OR the socket should be installed inside a cabinet locally. Oh, and about your kitchen safety?
