

Optocoupler Voltage Feedback

Overview

Numerous techniques and devices are available to the designers of optocoupler feedback circuits. Many supply manufacturers have elected to offer power supplies that satisfy all national and international safety insulation criteria by selecting power transformers and feedback devices that meet a 3750 VAC withstand test voltage. Feedback systems that use optocouplers easily comply with this. Optocouplers are critical in switch-mode power supply (SMPS) designs, enabling safe and reliable signal transmission across galvanic isolation boundaries. Although the TL431 is advertised as a transconductance amplifier, it can be used. The flyback converter is an isolated switching power supply topology widely used for output power levels below 150 W (Figure 1). In addition to providing galvanic isolation between input and output, it generates an output voltage which can be higher or lower than the input voltage. While these approaches do satisfy the.
