

Residual current protection directly trips to the first-level distribution box

Overview

All installations have an earth leakage current that is mainly due to the conductor's capacitive leakage and to anti-parasitic or EMI filtering capacitors, for example class I equipment. The sum of these leakage currents may cause highly sensitive residual protection – RCDs to. Selectivity between RCDs is achieved either by time-delay or by subdivision of circuits, which are then protected individually or by groups, or by a combination of both methods. Leak monitoring also helps detect insulation failures in conductors and loads. This type of fault can also jeopardize the continuity of supply to the. Residual current protection can detect and isolate the grounding (leakage) fault of low-voltage distribution networks in time, which is an essential technical measure to reduce electric shocks and fire accidents and improve power supply safety.
