

Setting up a static IP address on a telecommunications fiber optic router

Article Overview

You can set a static IP on a fiber optic router by accessing its admin panel, disabling DHCP for the device, and manually assigning an IP, subnet mask, and default gateway.

Step 1: Gather Network Information

Before configuring a static IP, collect the following details from a device already connected to your network:

- IP address range (e.g., 192.168.1.x)
- Subnet mask (commonly 255.255.255.0)
- Default gateway (usually the router's IP, e.g., 192.168.1.1)
- DNS servers (your ISP's DNS or public DNS like 8.8.8.8 or 1.1.1.1) Choose a static IP outside the DHCP range to avoid conflicts with other devices on the network .

Step 2: Access the Router's Admin Panel

- Connect your computer to the router via Ethernet or Wi-Fi.
- Open a web browser and enter the router's IP address (commonly 192.168.1.1 or 192.168.0.1).
- Log in with the admin username and password. If you haven't changed them, use the default credentials provided by the manufacturer .

Step 3: Configure the Static IP...
