

Standard Requirements for Cable Tray Thickness

Article Overview

Cable tray thickness is standardized based on tray type, material, and load requirements, typically ranging from 1.2 mm to 3.2 mm for steel and aluminum trays, with specific standards defined by IEC 61537, NEMA VE 2, and ISO 9241-5.

Standard Thickness Ranges

Cable tray thickness varies depending on tray type and material:

- Ladder trays: Designed for heavy cable loads and long spans, typically 2.0 mm to 3.2 mm for steel, and 1.5 mm to 2.5 mm for aluminum, ensuring structural integrity and minimal deflection under load .
- Perforated or trough trays: Provide continuous bottom support with ventilation; standard thickness ranges from 1.5 mm to 2.5 mm for steel and 1.2 mm to 2.0 mm for aluminum .
- Channel trays: Used for light to medium loads, often 1.2 mm to 2.0 mm for steel and 1.0 mm to 1.5 mm for aluminum .
- Wire mesh trays: Lightweight and flexible, typically 1.0 mm to 1.5 mm for steel or stainless steel, suitable for office or commercial installations .

Material Considerations

- Steel trays: Hot-dip galvanized or electro-galvanized steel thickness is critical for corrosion resistance and load-bearing capacity. Thicker steel increases durability an...
