

What are some Russian multimodal pigtail fibers

Article Overview

Multimode fiber optic pigtails, including OM1, OM2, OM3, and OM4 types, are widely used in Russia for short-distance, high-speed network applications.

Overview of Multimode Pigtails

A fiber optic pigtail is a short optical fiber with a factory-terminated connector on one end and a bare fiber on the other, designed for fusion or mechanical splicing to a main fiber cable. Multimode pigtails are primarily used for short-distance communication, such as within buildings, data centers, or campus networks, due to their larger core diameter and ability to carry multiple light modes .

Common Multimode Fiber Types

- OM1 (62.5/125 μm): Suitable for legacy networks and lower-speed applications, typically up to 1 Gbit/s over short distances.
- OM2 (50/125 μm): Supports higher speeds than OM1, commonly used for 1-10 Gbit/s links.
- OM3 (50/125 μm , laser-optimized): Designed for 10 Gbit/s and 40 Gbit/s over moderate distances, often used in modern data centers.
- OM4 (50/125 μm , enhanced laser-optimized): Supports 10-100 Gbit/s over longer distances, ideal for high-performance backbone networks .
